Breast-feeding an infant is a supply and demand function. The more (and longer) a baby nurses, the more milk is produced. This causes the milk supply to keep up with the growing and developmental needs of an infant. As explained in the definition of let-down reflex, there is front milk and hind milk.

Abstract. The pressures in the buccal cavities of Golden orfe (*Idus idus*)

have been recorded as the fish took food from a tube connected to a pressure transducer. Pressures 50–105 cm water below the pressure of the surrounding water were recorded as the buccal cavity expanded to suck the food in.

Feeding mechanics of the hammerhead shark. Crushing of hard prey by the oral jaws during feeding has been observed in only a few osteichthyan groups, such as the Sparidae, Tetraodontidae and Cichlidae (Christiansen, 1978; Liem, 1979, 1980; Barel, 1983; Buxton, 1984; Buxton and Clark, 1989, 1991; Sedberry, 1987, 1989; Vandewalle et al., 1995; Turingan and Wainwright, 1993; Wainwright and Turingan, 1993; Turingan, 1994; Hernandez and Motta, 1994).

One attempt to relate the fluid mechanics of suction feeding to skeletal mechanics models the cranial morphology as a single lever that transmits muscle force that acts to expand the buccal cavity (Carroll et al. 2004; Wainwright et al. 2007; Holzman et al. 2008a). Morphological measurements are used to estimate the muscle force (based on the physiological cross-sectional area of the epaxial muscles) that is transmitted through a simple lever mechanism to lift the head and expand the buccal ...

Sharks as a group have a long history as highly successful predatory fishes.

Although, the number of recent studies on their diet, feeding behavior, feeding mechanism, and mechanics have increased, many areas still require additional investigation.

Dietary studies of sharks are generally more abundant than those on feeding activity patterns, and most of the studies are confined to relatively ...
